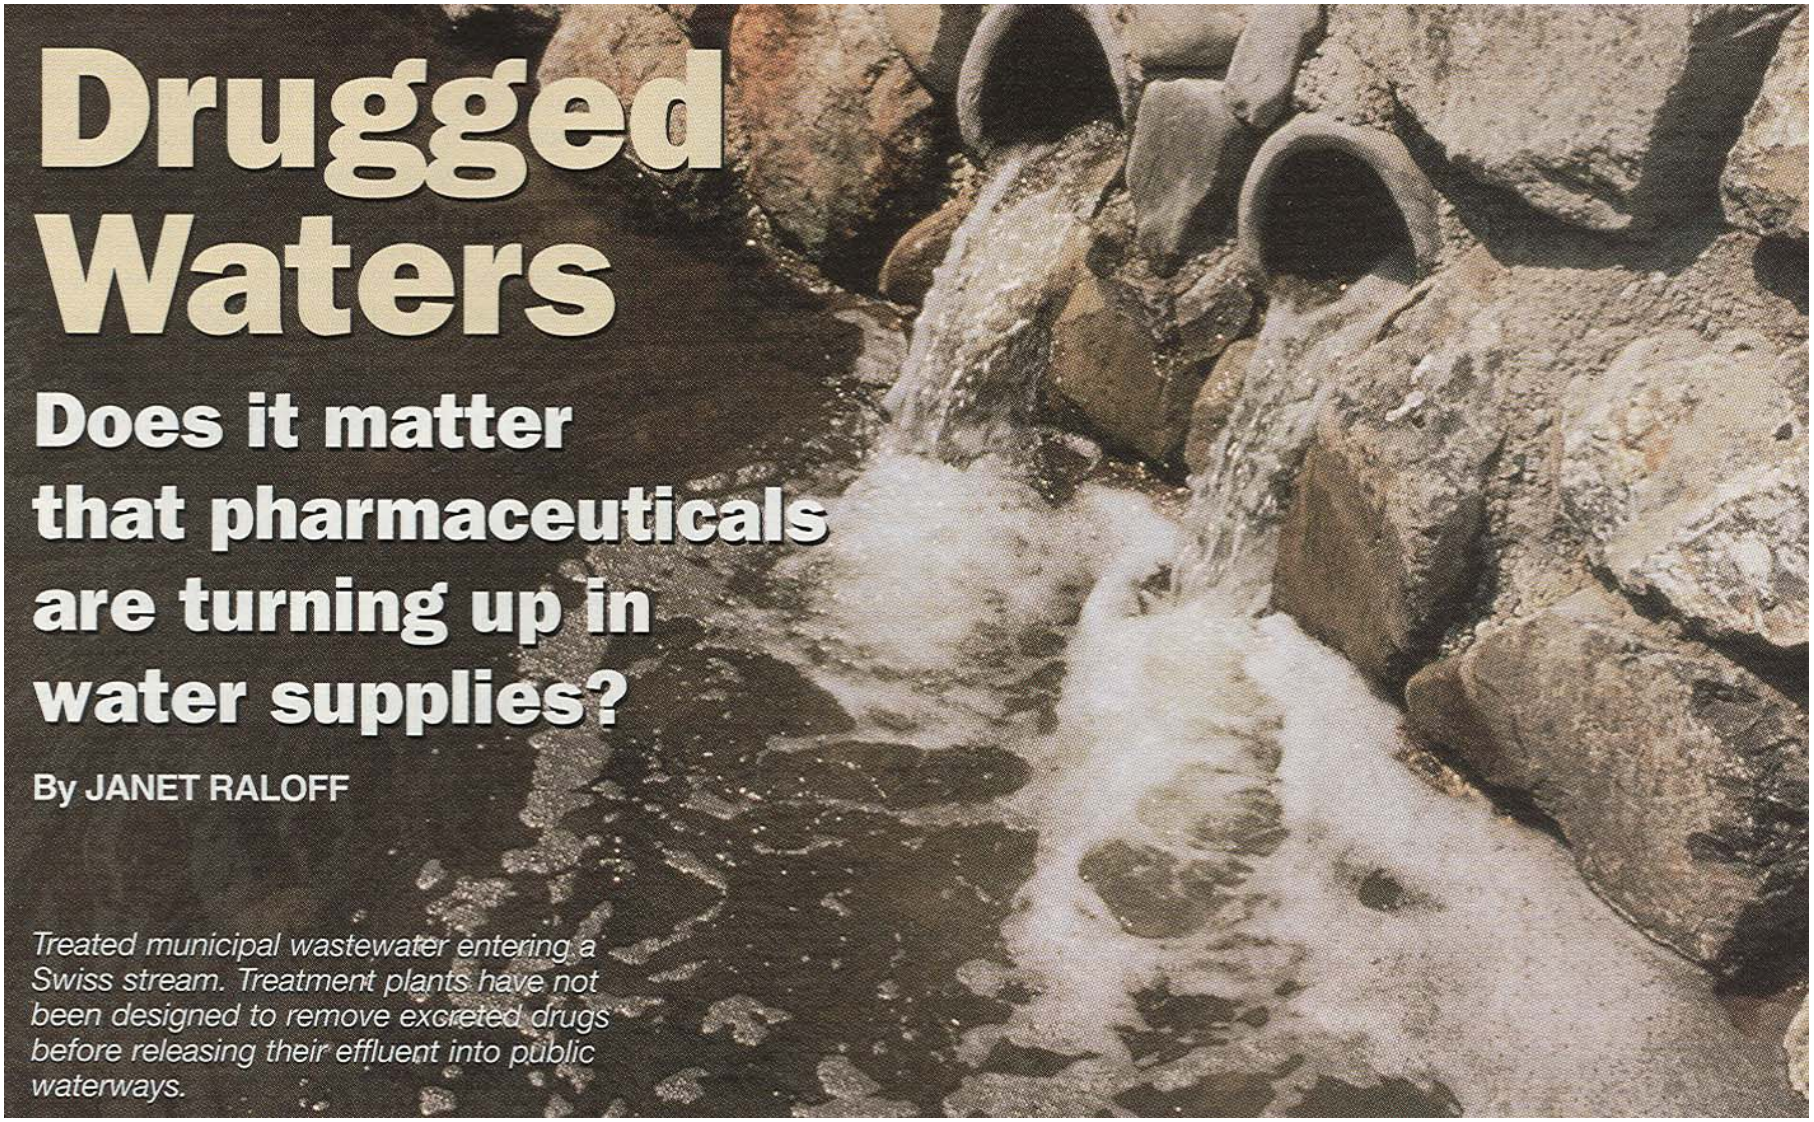
Drugged Waters

Does it matter that pharmaceuticals are turning up in water supplies?

By JANET RALOFF



Treated municipal wastewater entering a Swiss stream. Treatment plants have not been designed to remove excreted drugs before releasing their effluent into public waterways.

Analytical Methods

Environ. Sci. Technol. **2006**, *40*, 7312−7320

Analysis of Pharmaceuticals in Water by Isotope Dilution Liquid Chromatography/Tandem Mass Spectrometry†

BRETT J. VANDERFORD* AND SHANE A. SNYDER

Southern Nevada Water Authority, 1350 Richard Bunker Avenue, Henderson, Nevada 89015

pensate for matrix effects by using different calibration techniques, including standard addition (*13*, *17*, *22*), surrogate monitoring (*15*, *20*), and various forms of internal calibration (*14*−*16*, *19*, *23*). Still more have been developed to minimize matrix effects using different extraction, cleanup and elution techniques, including size-exclusion chromatography (*18*, *24*), solid-phase extraction (*22*), LC chromatographic procedures (*14*, *22*), ultra performance liquid chromatography (*25*), hollow fiber liquid-phase microextraction (*26*), flow-splitting and reduced eluent flow rates (*24*, *27*). However, most become problematic when applied to the simultaneous analysis of a broad range of compounds that encompass many different classes and structures in matrices having varying degrees of suppression and enhancement.

Pharmaceuticals and Endocrine Disrupting Compounds in U.S. Drinking Water

MARK J. BENOTTI,
REBECCA A. TRENHOLM,
BRETT J. VANDERFORD,
JANIE C. HOLADY,
BENJAMIN D. STANFORD, AND
SHANE A. SNYDER*

Southern Nevada Water Authority, P.O. Box 99954, Las Vegas, Nevada 89193-9954

Received July 3, 2008. Revised manuscript received October 3, 2008. Accepted October 13, 2008.

pharmaceutical at subμg/L levels is negligible (*8*), it is not clear what toxicological implications chronic exposure to suites of trace contaminants may pose (*9*, *10*). The degree to which this issue has drawn interest across disciplines is illustrated by the voices of concern stemming from medical professionals, environmental scientists, drinking water municipalities, government agencies, and the general media (*9*, *11*–*13*). However, if risk assessors and epidemiologists are to link any potential health outcomes with pharmaceutical and EDC occurrence, a better understanding of their occurrence in drinking water is critical.

There is relatively sparse information regarding pharmaceutical and EDC occurrence in drinking water. Researchers in Germany measured ng/L concentrations of clofibric acid in Berlin tap water (*14*), a case which remains a strong illustration of the sometimes close wastewater to drinking water coupling of unintended water reuse. The elimination of pharmaceuticals at German DWTPs was attributed to ozone oxidation or adsorption to granular activated carbon (*15*): finished drinking water concentrations

"Identifying Hormonally Active Compounds, Pharmaceutical Ingredients, & Personal Care Product Ingredients of Most Health Concern From Their Potential Presence in Water Intended for Indirect Potable Reuse"

WRF 05-005 – Expert Workshop
November 5-6th, 2008

Southern Nevada Water Authority

WATEREUSE FOUNDATION

INTERTOX

Approach

- Gather Data from Published Toxicological Studies
- Use Data to Obtain Uncertainty Factor (UF) and Effect Dose
- Use 7 Methods to Obtain Screening Levels
  - NOAEL/LOAEL, Minimum Therapeutic Dose, 2 TTC-Based Approaches, Cancer Slope Factor (CSF), Maximum Tolerated Dose, and Existing Toxicity Critereon
- Compare Results, Choose Most Conservative (Protective of Public Health)

Describe Methods for Deriving Human Health Risk-Based Screening Levels

Considered Four Approaches:

a) *For noncarcinogenic effects:* No observed adverse effect level (NOAEL) or lowest observed adverse effect level (LOAEL) from toxicology studies in humans, with uncertainty factors applied

b) *For carcinogenic effects:* Tumor incidence data and linear extrapolation models to derive cancer slope factors (SFs) and target levels based on incidence of cancer

c) *For drugs:* Minimum therapeutic dose

d) *Threshold of Toxicologic Concern (TTC)*

Toxicological Data Used to Develop Screening Levels for Noncancer Endpoints for Target PPCPs

Compound	Species/ Gender/ Study duration	Effect dose (mg/kg-d)	Effect	Composite UF [a]	Screening level (µg/kg-d)
Alendronate	Rat/ F /Premating- gestation	0.5 (LOAEL)	Reproductive (protracted parturition)	3,000 (10,3,10,3,3)	0.17
Atenolol	Human/F /Gestation	0.80 (LOAEL)	Developmen l (decreased infant birth weights)	300 (1,3,10,3,3)	2.7

Female rats exposed from before mating through gestation

Lowest observed adverse effect level in database (of 9 studies)

Reproductive effect (protracted birth)

UFs: 10 for animal to human, 3 for sensitive members of population, 10 for LOAEL to NOAEL, 3 for study duration, 3 for lack of a 2-generation study in database

0.0005 µg/kg-d/ 3,000

PPCPs with Evidence of Carcinogenicity and Tumor Data, and Slope Factors (SFs) and Screening Levels

Compound	Evidence	Tumor incidence data	Cancer SF $(mg/kg\text{-}d)^{-1}$	Screening level based on CSF (µg/kg-d)
Fluconazole	Hepatocellular adenomas in rats (M)	CPDB 2007a: 2 yr, rat (M) 0 mg/kg-d= 2/100 2.5 mg/kg-d = 0/50 5.0 mg/kg-d = 4/50 10 mg/kg-d = 5/50	1.1E-02	0.21

Evidence of liver cancer in male rats

Tumor incidence data: 2 year study at 4 dose levels

Cancer slope factor derived using tumor incidence data and EPA Benchmark Dose Model (estimate dose that produces 10% excess risk, then extrapolate to produce upper-bound estimate risk per 1 mg/kg-d of dose

Calculated assuming an acceptable lifetime excess cancer risk of 1 in one million, and that a person is exposed to this dose 365 d/yr for 30 yrs over a 70 yr lifetime
$= (10^6 \times 25{,}550)/ (SF \times 10.950)$

Minimum Therapeutic Doses for Target PPCPs and EDCs, and Corresponding Screening Levels

Compound	Treatment Endpoint	Ther Dose (mg/kg-d)	Traditional UF [a]	Pregnancy Category & Adverse Human Effects at Ther Dose	Adverse Effects in Animals (Relative to Ther Dose)	Proposed Additional UFs	Screening Level (µg/kg-d)
Alendronate	Osteoporosis	0.071	300 (1,3,10,3,3)	C	Cancer; Repro, rat: 1.1x; Devel, rat: 2.3x	3-cancer	0.080
Aten[illegible]ol	Hype[illegible]tension	0.36	300 (1,[illegible]10,3,3)	D (low birth we[illegible]ht)	Canc[illegible]: Repro, rat: 4.2x	3-de[illegible]l; 3-cancer	0.12

Fosamex®

Treatment for osteoporosis (bisphosphate inhibitor of bone resorption)

Minimum therapeutic dose for adults (5 mg/d)

UFs: 1 for animals to humans, 3 for intra-individual variability, 10 for LOAEL to NOAEL, 3 for study duration, 3 for database uncertainties

FDA pregnancy category

Evidence of toxicity in animals: cancer of Harderian gland in mice (not likely relevant to humans) and thyroid in rats; reproductive effects in rats (protracted parturition) at 1.1x therapeutic dose; developmental effects (reduced body weight gain in rat pups) at 2.3x therapeutic dose)

Additional UFs

Threshold of Toxic Concern (TTC)-based Screening Levels for PPCPs

Compound	Structural class*	Genotoxicity test result	Minimum Oral LD50 (mg/kg)	TTC-based screening level (µg/kg-d)	
				Based on scheme of Cheeseman *et al.* (1999)	Based on scheme of Kroes *et al.* (2004)
Alendronate	III	Negative	27,800 (mouse)	0.21	1.3
Aten[illegible]	[illegible]	[illegible]egative	2,00[illegible] (mouse)	[illegible]0.21	[illegible].3
-	---		--	---	-

Fosamex®

Compounds that suggest "significant toxicity"; contains phosphonate groups

Negative in Ames test and in vitro micronucleus assay

Minimum oral lethal dose to 50% of a test population

Compounds with negative genotoxicity tests and no structural alerts

Cramer structural class III compounds

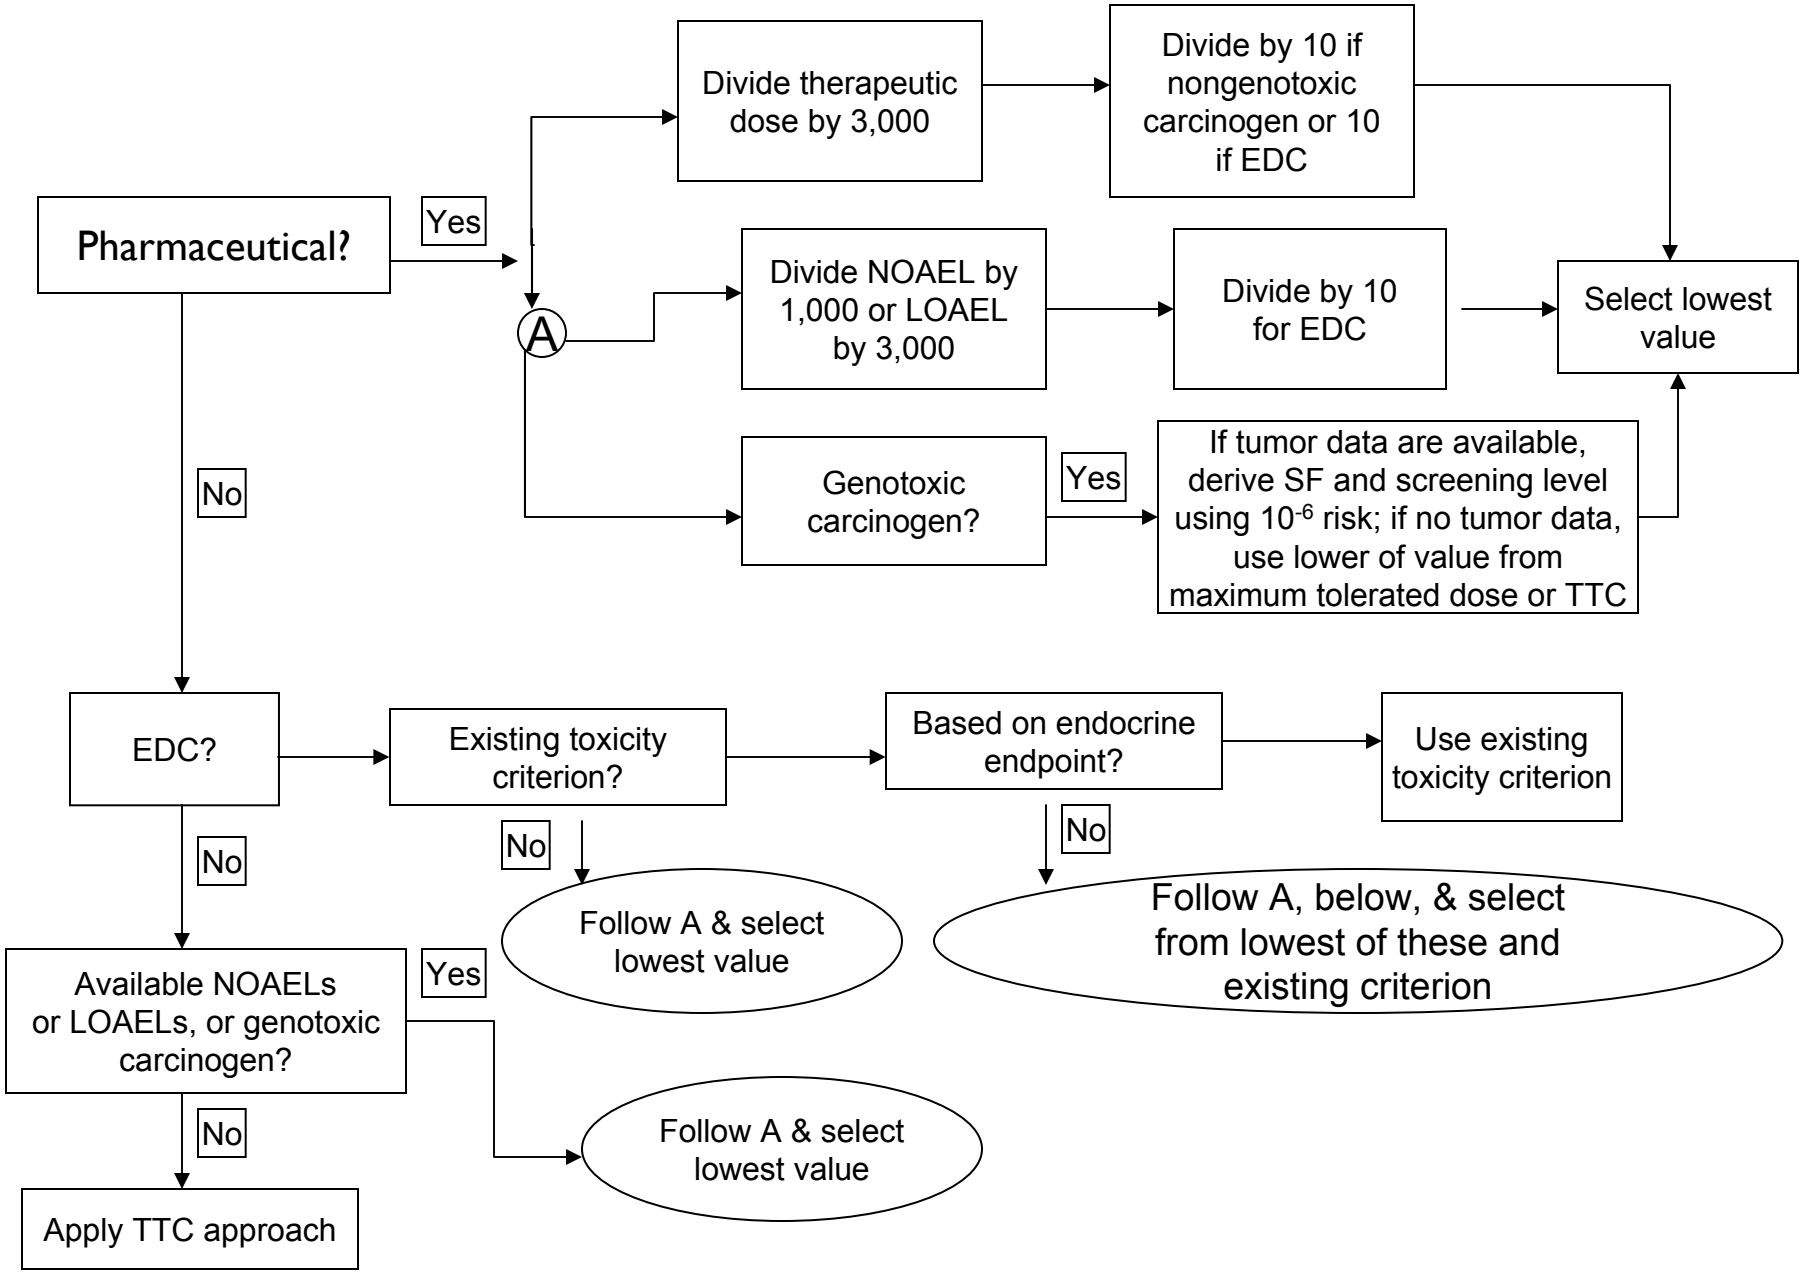
Derived Screening Values From Seven Approaches (µg/kg-d)

	Atenolol	Atrazine	Ethinyl Estradiol	Meprobamate
Based on NOAEL/LOAEL	0.027	0.05	**0.0000033**	75
Based on Minimum Therapeutic Dose	**0.012**	NA	0.00001	2.3
Cheeseman *et al.* (1999) TTC Approach	0.21	0.021	0.43-0.64	**0.021**
Kroes *et al.* (2004) TTC Approach	1.3	1.3	26	1.3
Based on CSF	NA	**0.0043**	0.012	NA
Based on Max. Tolerated, Dose (Carcinogens)	2	0.027	0.00059	NA
Existing Toxicity Criterion	NA	**0.0043**	0.00043	NA

“New” Derivation of Screening Levels

- Based on Blanket Uncertainty Factors:
  - 1,000 if NOAEL Data Are Available
  - 3,000 if only LOAEL Data Are Available
  - Multiply by additional factors of 10 when
    1. Compound is a Non-genotoxic Carcinogen
    2. Compound is a known EDC
- Provides Ease of Use in Process
  - Still Maintains Robust Approach through Multiple Derivations of Screening Levels

DRAFT Decision Tree for Screening Levels (WRF 05-005)



Example Process for NOAEL/LOAEL Approach

	Atenolol	Atrazine	Ethinyl Estradiol	Meprobamate
Description	PPCP	Herbicide & EDC	PPCP & EDC	PPCP
Effect	Developmental (Human)	Developmental (Rat)	Endocrine (Human)	Systemic (Mouse)
Effect Dose (mg/kg-d)	0.8	0.5	0.0001	75
NOAEL or LOAEL	LOAEL	NOAEL	LOAEL	NOAEL
"Old" UF	3000	5000	1000	10,000
Genotoxic?	No	No	No	No
Carcinogenic?	Yes, Thyroid	Yes, Mammary	Yes, Liver	No
"New" UF	3000 x 10	1000 x 10	3000 x 10	1000
New Screening level (µg/kg-d)	0.027	0.05	0.0000033	75

Conclusions

BUT What about the MIXTURES?

WHO – Drinking Water Quality Guidelines

8.2.9 Mixtures

Chemical contaminants of drinking-water supplies are present with numerous other inorganic and/or organic constituents. The guideline values are calculated separately for individual substances, without specific consideration of the potential for interaction of each substance with other compounds present. The large margin of uncertainty incorporated in the majority of the guideline values is considered to be sufficient to account for potential interactions. In addition, the majority of contaminants will not be continuously present at concentrations at or near their guideline value.

Chemicals cause changes in fish and raise concerns for humans

By Launce Rake <lrake@lasvegassun.com>

Las Vegas Sun

There's something wrong with the fish.

It's been confounding scientists for years: Male fish are developing female sexual characteristics in Lake Mead and other freshwater sources around the country.

On Thursday, the U.S. Geological Survey released a four-page summary of more than a decade of studies linking wastewater chemicals to those changes.

ZERO

Conclusions

- Trace amounts of steroids and pharmaceuticals have been reported in water for more than 30 years
- Robust analytical methods are capable of accurately detecting and quantifying chemicals in water at levels < 0.000000001 g/L
- Only 11 of 62 target compounds were detected in finished drinking water (>20% frequency)
  - Atrazine had highest frequency at 83%, but at less than 1/3rd the MCL
  - If MRLs were 10 ng/L, then 9 of 62 would have been detected
  - If MRLs were 100 ng/L, then 3 of 62 would have been detected
  - If MRLs were 1000 ng/L, then no compounds would have been detected
- Exposure to estrogenic chemicals in diet are far greater than in drinking water
- Toxicological relevance is critical in order to establish meaningful treatment and analytical goals

Conclusions

- Using EPA risk assessment paradigm, the DWELs for indicator pharmaceuticals and EDCs are FAR higher than occurrence
  - Pharmaceuticals have the "richest" toxicological data of any environmental contaminants (human data)
  - Conservative uncertainty factors used
  - Even if additional uncertain factors of 10-100x were applied for synergism/additivity, the DWELs would still be higher than occurrence
- The energy/water nexus is absolutely critical
  - We must avoid "moving" our pollution from water to air
  - Holistic risk evaluation is needed – "cradle to grave"
- Rapid screening values can be developed to allow a "ball park" assessment of human health relevance from minimal datasets
